

Filter Cartridges

Menardi manufactures filter cartridges to OEM specs for a wide variety of applications.

The Menardi Difference

For more than 80 years, Menardi has been a leader in meeting industrial filtration needs. Our extensive capabilities guarantee you an exact fit and equal or better performance. Our experienced representatives are trained to provide quick, efficient service.

When You Need More Than a Replacement Cartridge

If there has been a change in your filter loading, operating temperature, dust characteristics, or other aspect of your process, then you may need to change your media. In our 80+ years, we have accumulated a treasure trove of experience that's at your disposal. Our experts will guide you to the solution that best meets your economic and performance requirements.

Patented Technology Provides Increased Filter Area

The practical pleat depth for most synthetic filter media is 1.25". Beyond that, operating pressure collapses the upper portion of the pleat, resulting in very little gain in usable filter area.

Our patented MikroBoss™ media uses staggered embossing to prevent pleats from collapsing. This allows a pleat depth of nearly 2", resulting in 55% increased usable filter area in the same size cartridge. It's available in spunbond and spunlaid polyester and polypropylene, as well as PTFE membrane and antistatic media.

Our construction quality is second to none, with a heavy weight expanded metal core and deep urethane potting to ensure a complete seal.

ISO 9001 : 2000
Registration No. A2740
